

HEALTH TRACK

Kalys Kozhomberdiev

EEAIR-23

Purpose

That allows to keep track health of yours or your family just by inputting their values

Support Functions

waitForEnter

*Just cleares up the screen
making it more readable*

viableBody

*Checks if new body is possible and
fits into the standarts of WHO*

savePatientsFile - getPatients

*Saving and loading users from
patients.txt file*

get_info

*getting main medical
information from json file*

CRUD (main functionality)

add_body

Because Update and Create functionality is similar to each other and to avoid duplication of code I made both of them into one function

get_patients

Gets all patients and shows them in the most desirable way

delete_patient

Deletes user by their name in database

Conclusion

*That was my final project for the first class
of the university and I hope it proved that I
improved in C++ and ready to move to the
next course!*

Thx for the attention!
